

## Question

Is there one best way to maintain Stainless Steel surfaces in buildings?

## Answer

The procedure for restoring Stainless Steel from years of Stainless Steel Cleaner build-up is this:

1. Dilute Tom Shirley's Showers N Stuff by adding one part of Showers N Stuff to 5 parts of water.
2. Apply liberally over a small area (2' x 2') using a soaking wet huck towel.

3. Keep wet for a few seconds (10 to 30).
4. Rub gently in a circular pattern with gloved fingers (although Tom always did it with his bare hands). It should look milky as the Stainless Steel cleaner or polish comes out of the Stainless Steel.
5. Rinse with clear water.
6. Repeat rubbing in a circular pattern with the rinse solution on the Stainless Steel.
7. Wipe with a clear water dampened cloth in the direction of the Stainless Steel grain (go with the grain).
8. Fan dry with your cloth until completely dry.
9. If the Stainless Steel looks clean and shiny, you have cleaned it. If it looks streaky it is either still wet or it still contains Stainless Steel cleaner. Make sure it's dry (usually a minute or two). Repeat 1-8 if it's still cloudy.

10. When finished and looking clean and shiny you can apply Beauty Seal over the surface. Make sure you use a natural cotton cloth not synthetic, microfiber or paper. White Turkish Towels are the best, huck towels are good.
11. Fan dry (you can wave the towel).
12. After it dries clean it daily with glass cleaner.
13. Reapply Beauty Seal from time to time to resist marks.
14. When this procedure is performed Stainless Steel elevators look almost like they are chrome.
